

Thank you for viewing the Model Earthen Embankment.

The design plan view of the earthen embankment below indicates the height of the embankment is +7 feet above sea level. As you view the model berm, the height of the embankment relative to the ground level in the duckwalk area of Long Wharf Park is 3-4 feet.

The earthen embankment will be planted with grass, maintaining the overall aesthetic of the Long Wharf Park area.

As shown on the graphic above, the dotted line following the shoreline indicates the flood protection embankment; the green dotted line indicates earthen embankment, while the black dotted line indicates rock filled embankment.
